EnviroNize® is pleased to announce that electrolyzed water has been approved by the **Organic Federation of Canada** as an organic cleaner, disinfectant, and sanitizer.

EnviroNize® generators use salt, water, and electricity to produce electrolyzed water rich in hypochlorous acid, an incredibly powerful biocide that is not only environmentally friendly in its production and efficacy, but has been found to be two orders of magnitude more effective than bleach, non-toxic to biologic tissues, and safer than both peracetic acid and quaternary ammonium.

In addition to being approved as an organic cleaner, sanitizer, and disinfectant, the Organic Trade Association also found that hypochlorous acid is ***“... a material that has strong antimicrobial properties and is more compatible with the fundamental principles of organic production.”***

Beyond the incredible efficacy and strong endorsement by the OTA, hypochlorous acid is also widely accepted, at a variety of concentrations, as a fruit and vegetable wash, carcass wash, no-rinse food contact surface sanitizer, and a hard surface disinfectant, making hypochlorous acid one of the most flexible products available for organic growers.

This incredibly powerful and versatile solution is available through **EnviroNize**®, both in packaged formats and, for larger customers, by purchasing your own onsite hypochlorous acid generator that can supply your entire onsite requirement for sanitizers and disinfectants, providing you with an unprecedented level of safety, efficacy, independence, and control.
